

DC TO DC CONVERTER CONTROLLER

DESCRIPTION

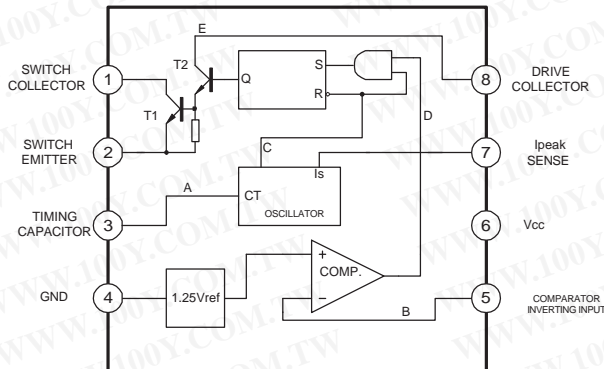

The TD34063 Series is a monolithic control circuit containing the primary functions required for DC to DC converters. These devices consist of an internal temperature compensated reference, comparator controlled duty cycle oscillator with an active current limit circuit, driver and high current output switch. This series was specifically designed to be incorporated in Step-Down and Step-Up and Voltage-Inverting applications with a minimum number of external components.

FEATURES

- *Operation from 3.0V to 40V.
- *Short circuit current limiting.
- *Low standby current.
- *Output switch current of 1.5A without external transistors.
- *Frequency of operation from 100Hz to 100kHz.
- *Step-up, step-down or inverting switch regulators.

Operating Junction Temperature	T_J	+150	$^\circ C$
Operating Ambient Temperature Range	T_A	0 to +70	$^\circ C$
Storage Temperature Range	T_{stg}	-65 to +150	$^\circ C$

NOTE :

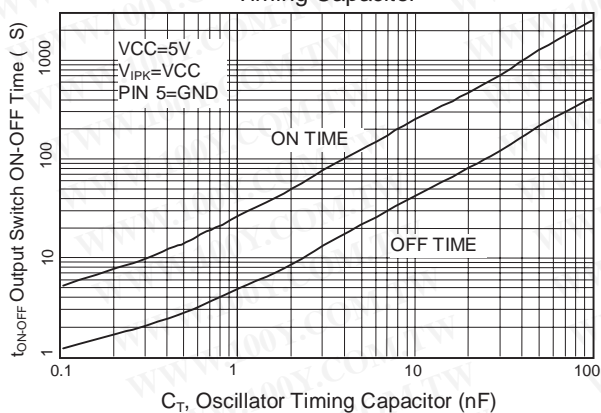

- Maximum package power dissipation limits must be observed.
- ESD data available upon request.
- $T_{low} = 0^\circ C$, $T_{high} = +70^\circ C$
- Low duty cycle pulse techniques are used during test to maintain junction temperature as close to ambient temperature as possible.
- If the output switch is driven into hard saturation (non-Darlington configuration) at low switch currents (300mA) and high driver currents (30mA), it may take up to 2.0 μs for it to come out of saturation. This condition will shorten the off time at frequencies 30kHz, and is magnified at high temperatures. This condition does not occur with a Darlington configuration, since the output switch cannot saturate. If a non-Darlington configuration is used, the following output drive condition is recommended:

Forced of output switch: $\frac{I_{c \text{ output}}}{I_{c \text{ driver}} - 7.0 \text{ mA}^*} \geq 10$

*The 100 resistor in the emitter of the driver device requires about 7.0 mA before the output switch conducts.
